SEF Entropics Cat Bond Fund – Class I

Performance[1]

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	YTD
2017				0.05%	-0.06%	0.20%	0.43%	0.56%	-5.53%	1.35%	-0.44%	0.04%	-3.52%
2018	0.90%	-1.28%											-0.39%

Manager's Notes

The Fund's institutional class returned -1.28% in February. The negative return has been caused by new loss estimates that have been issued primarily for the extreme wildfires in California in 2017. The new estimates have exceeded market expectations. The wildfires of the past year would in normal years not have been sufficiently large to affect the positions, but in combination with hurricane losses, the retentions of affected positions with aggregate retentions are believed to have eroded, fully or partly.

The latest loss estimates with increasing losses have primarily affected two positions during the past month. The estimates can be revised up as well as down in the months to come, until final claims are settled. We continue to monitor developments closely.

Since the last report, four new bonds have been offered to the market, all of which have two classes and indemnity triggers. The total volume of these bonds is USD 1.3 billion, covering, among others, earthquake, typhoons, flooding and fire following earthquakes in Japan, as well as wind perils in Florida, Louisiana and Texas.

The Fund has assumed two new positions: one on the primary market covering earthquakes in Japan and on on the secondary market covering multiple perils in the USA. The secondary market trading encompassed some 50 positions, covering most perils on the market, according to FINRA's Trade, Reporting and Compliance Engine (TRACE). The Fund's YTM amounts to 14.50%, which is explained by reduced market prices of four positions due to expected losses that still pay full coupons. YTM excluding these four bonds amounts to 6.82%.

Portfolio Summary[2]

Yield to Maturity	14.50%
NAV	96.10
YTD	-0.39%
Last 3 months	-0.35%
Last 12 months	-
Since Inception 2/16/15	-3.90%
Volatility	—
Active Share	56.1%
AUM (SEK M)	213
Cash Allocation	4.9%
Number of Cat Bond positions	61
Solvency Capital Requirement (SCR)	13.20%

Maturity Profile

1) 0Mo - 6Mo Maturity	14.5%
2) 6Mo - 1.0Yr Maturity	11.5%
3) 1.0Yr - 2.0Yr Maturity	14.1%
4) 2.0Yr - 3.0Yr Maturity	40.9%
5) > 3.0Yr Maturity	19%

Annualized Risk Characteristics

Portfolio Expected Loss	2.19%
VaR (90%)	5.24%
VaR (95%)	12.68%
VaR (99%)	36.34%
TVaR (99%)	41.27%
Probability of 0% PL	57.38%

Historical Event Loss Analysis –
Most severe impact on the portfolio[4]

1906 San Francisco CA	30.9%

SEF Entropics Cat Bond Fund

SEF Entropics Cat Bond Fund is an actively managed fund that invests in global reinsurance risks covering natural catastrophes (Cat Bonds). The Fund aims for a good risk adjusted return with very low correlation to other asset classes and good diversification among the underlying insurance risks.

The web site en.entropics.se provides additional information on the SEF Entropics Cat Bond Fund, including the Key Investor Information Document (KIID) and the Fund's prospectus.

Historical return is not a guarantee for future returns. The money you invest in the Fund can increase as well as decrease and you cannot be certain to have the full investment returned.

Entropics Asset Management

Entropics Asset Management AB is the first Scandinavian asset manager specialised in Cat Bond investments.

The team has broad experience from asset management, underwriting, meteorology, underwriting, cat claims settlements and financial mathematics.

Entropics is licensed by and under the supervision of *Finansinspektionen*, the Swedish Financial Supervisory Authority.

Information on Risk Metrics

The risk measure for Cat Bonds and thus for Cat Bond portfolios is closely linked to reinsurance terminology. The following terms describe, briefly, the central portfolio risk metrics used by Entropics.

PRINCIPAL (Π_0): The Principal of a Cat Bond is the amount deposited as collateral for the bond's reinsurance commitment. A portfolio's total principal (Π_0) is the total amount exposed to damage events and, thus, generating returns.

LOSS (L) AND LOSS RATIO ($x=L/\Pi_0$): The total loss (L) is a monetary value, and to the Loss Ratio $x = L/\Pi_0$ is a relative measure of the loss size, with a range of $0-100\%$.

PROBABILITY OF ATTACHMENT (P_{att}): P_{att} describes the probability that a portfolio will sustain any damage at all. This probability generally increases with the number of (uncorrelated) bonds in the portfolio.

PROBABILITY OF 0% LOSS (P_0): P_0 is simply the probability of no loss at all and its relation to P_{att} is thus $P_0 = 1 - P_{att}$.

PROBABILITY OF EXHAUSTION (P_{exh}): Indicates the probability that the portfolio sustains a damage equal to the entire principal Π_0. P_{exh} is only notable for portfolios with few bonds. For portfolios with many (uncorrelated) bonds, it is all but infinitesimal.

EXPECTED LOSS (EL): The mean loss of a Cat Bond or a portfolio of Cat Bonds. Actual losses will often be 0% (as described by P_{att}), but losses, when occur-

ring, will often be considerably larger than EL. The loss thus in general shows considerable variation around the mean loss EL.

STANDARD DEVIATION (σ): To express the volatility of loss around the mean EL, the standard deviation of the loss, σ, is used.

VARIATION COEFFICIENT ($\mu = \sigma/EL$): The variation coefficient describes the volatility in relation to the mean loss, EL. The coefficient increases with the volatility of the portfolio.

EXCEEDANCE PROBABILITY (EP): Though the EL generally is low and the probability of no loss is high, actual losses have a wide spread. EP(x) is the probability that a loss is equal to or bigger than the loss ratio x. EP is usually on a yearly basis and is presented as a function of the loss ratio x.

LOSS DISTRIBUTION (Q(x)): Q(x) is the probability distribution of the loss and is calculated as Q(x)=-EP'(x).

VALUE AT RISK (VaR): VaR(Y) is the loss that with the probability Y is not exceeded on a yearly basis.

TAIL VALUE AT RISK (TVaR): TVaR(Y) is the mean of all losses exceeding VaR(Y).

Mathematically, this means that $TVaR(Y) = \dfrac{\int_{VaR(Y)^+}^{\infty} x \cdot Q(x)dx}{\int_{VaR(Y)^+}^{\infty} Q(x)dx}$

Footnotes

1. Performance is reported by Swedbank AB and reflects the Fund's Net Asset Value after fees
2. Yield to Maturity is calculated before applicable fees. In accordance with the Solvency 2 directive, a cat bond investment is considered as an insurance risk on the asset side. The Solvency Capital Requirement, SCR (as a monetary amount) for this specific risk is calculated as a percentage of the Assets Under Management (AUM).
3. Risk distribution and profile are calculated by portfolio modelling in AIR CATRADER, being the industry standard tool used by asset managers and re-insurers worldwide to model and analyse catastrophe bonds and other insurance

linked securities. "Other perils" indluces perils other than wind and earthquake, e.g. wildfires and flooding. The portfolio can also include unmodelled risks, such as volcano eruptions and meteorite impacts, with extremely low and uncalcuable frequency..
4. The historical event loss analysis describes the loss as a percentage of the portfolio if these events were to occur today.
5. Financial key figures are based on ten years weekly data from Bloomberg.
6. A description of the RI indicators can be found at Entropics' blog:
http://en.entropics.se/blog/how-to-interpret-entropics-indicators-for-responsible-investments/
